StarLine TM

Immunoaffinity Columns

StarLine™ immunoaffinity columns represent a simple and reliable clean-up before detection of mycotoxins and vitamins in a broad range of foodstuffs and animal feed.

How StarLine™ Immunoaffinity Columns work

StarLine™ immunoaffinity columns (IAC) are based on a specific antibody-analyte binding technology. Immunoaffinity columns contain a gel bed with toxin-specific antibodies coupled to the gel particles. These antibodies will capture the analytes of interest in a sample and release them after a washing step, where impurities are washed from the column.

Applications

StarLine™ immunoaffinity columns have been designed for simple and reliable clean-up before detection of mycotoxins and vitamins in a broad range of different commodities including feed.

StarLine™ immunoaffinity columns have been validated in an extensive testing program and can be used for the purification and concentration of mycotoxins and vitamins prior to analyses by various techniques, such as HPLC, GC-MS, LC-MS, ELISA or direct fluorometry.

Portfolio

All immunoaffinity columns are available in a 3 mL format. In addition immunoaffinity columns for aflatoxins are available in a 1 mL format.

PRODUCT FEATURES

- Accurate and reliable results
- Highly specific monoclonal antibodies
- Long shelf life
- Can be used with different extraction solutions and for different contamination levels

Wide Application Range

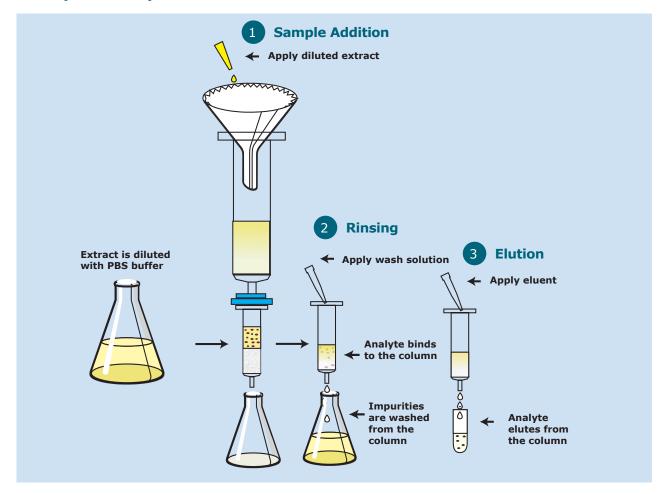

- For a broad range of commodities including feed
- Various application notes available
